repräsentative Poynter-Media-Trust-Umfrage (Guess & Nyhan & Reifler, 2017). Darin gab zuletzt nur jeder siebte (14 Prozent) Unterstützer der republikanischen Partei an, den Massenmedien zu vertrauen. Diese Menschen billigen zudem deutlich häufiger extreme Behauptungen, in denen Medien der Lüge bezichtigt werden. Mehr als die Hälfte der Befragten (60 Prozent) stimmten der Aussage des Präsidenten zu, Medien seien "Feinde des amerikanischen Volkes".

Fake-News für Republikaner?

»Ich vertraue den Massenmedien!« Wie sehr stimmten US-Amerikaner je nach politischer Richtung dieser Aussage in den vergangenen 20 Jahren zu?

Nie zuvor lagen Anhänger der Demokraten weiter auseinander mit Anhängern der Republikaner als im Jahr 2017.

Quelle: Gallup (Meinungsforschungsinstitut) • Daten

Im Gegensatz dazu gaben 72 Prozent der Demokraten an, den Medien zu vertrauen – ebenfalls ein Rekord. Seit den Terroranschlägen vom 11. September 2001 habe es so eine Unterstützung nicht gegeben, schreiben die Autoren der Studie. Offenbar hoffen Anhänger der Demokraten, dass eine unabhängige Presse den Präsidenten für seine Taten und Entscheidungen verantwortlich macht, gerade in einer Zeit, in der seine republikanische Partei beide Kammern des Kongresses kontrolliert. Dazu passt, dass vor allem die vom Präsidenten verhassten Zeitungen *New York Times* und *Washington Post* im vergangenen Jahr Hunderttausende neue Abonnenten dazugewonnen haben.

zum Freeriden oder Skitourenfahren gehen will, sollte sich auf diese Informationen stützen und braucht die dazu nötige Ausbildung.

ZEIT ONLINE: Werden nicht auch extra Lawinen gesprengt, bevor sie von selbst abbrechen?

Stucki: Ja, auf diese Weise schützen die lokalen Lawinendienste Straßen oder Skipisten. Während solcher Lawinensprengungen werden in Skigebieten Pisten zeitweise gesperrt. Sie werden danach aber wieder freigegeben. Dass der Betrieb in einem ganzen Skigebiet eingestellt wird, kommt eher selten vor, zum Beispiel wenn wegen schlechten Wetters nicht gesprengt werden kann, die Präparation aufgrund von sehr viel Schnee mehr Zeit braucht oder es stürmt. Selbstverständlich sind die Leute gehalten, sich an die Anweisungen der lokalen Behörden zu halten, also zum Beispiel gesperrte Wege nicht zu begehen.

ZEIT ONLINE: Wie können Skifahrer, Snowboarder und Tourentäger, die im freien Gelände unterwegs sind, Unfälle vermeiden?

Lawinentote in den Schweizer Alpen

Häufigkeit von tödlichen Lawinen-Unglücken je nach Region in den Jahren 1997 bis 2017

Landwirtschaft. Jeder dritte Job hängt von Wasser ab. Im Umkehrschluss heißt das: Ohne Wasser haben viele Menschen schlicht keinen Job oder keine Ernte.

Gefahr durch unsicheres Wasser

Kochen, persönliche Hygiene, die Wohnung sauber halten und Wäsche waschen: Auch für diese Dinge wird ungefährliches Wasser benötigt. Wo das fehlt, wird gezwungenermaßen verunreinigtes Wasser genutzt. Die Folge: Erkrankungen wie Cholera oder Bilharziose, die im Extremfall zum Tod führen können.

Tote durch verunreinigtes Wasser

Quelle: Universität Washington (Bezugsjahr 2017)

DER SPIEGEL

Bei Todesfällen durch verunreinigtes Wasser belegen ausschließlich afrikanische Staaten die oberen Plätze: In der Zentralafrikanischen Republik, dem Tschad, Eritrea und im Südsudan starben 2017 mehr als 100 Personen pro 100.000 Einwohner an verunreinigtem Wasser.

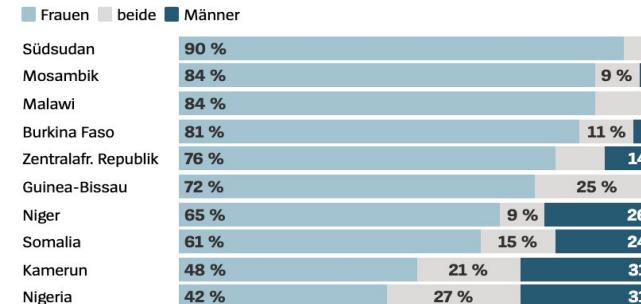

Der weltweite Trend ist zwar rückläufig, doch es gibt eine Ausnahme: die Zentralafrikanische Republik. Dort stieg die Todesrate zwischen 1990 und 2017 um 14 Prozent. Die genauen Ursachen sind unklar, die anhaltende militärische Krise im Land dürfte eine Rolle spielen. Im restlichen Subsahara-Afrika hat sich die Zahl der durch verunreinigtes

Menschen gleich stark erhöht: Entwicklungsländer sind stärker betroffen als Industriestaaten, Alte, Kranke und Kinder stärker als gesunde Erwachsene, Landbewohner stärker als Stadtbewohner - und Frauen stärker als Männer. So sind es meist Frauen und Mädchen, die dafür zuständig sind, Wasser aus den Quellen zu holen.

Datawrapper-Diagramme auf **spiegel.de**

Auf dem Land besorgen oft Frauen das Trinkwasser

Wer ist in ländlichen Haushalten primär für das Wasserholen zuständig?

Quelle: Unicef (Stand 2017)

DER SPIEGEL

Eine zweite Dimension der ungleich wirkenden Wasserkrise zeigt sich beim Unterschied zwischen armen und wohlhabenden Menschen: "Slumbewohner müssen sehr viel mehr für einen Liter Wasser zahlen als die Reichen, die 200 Meter weiter leben - obwohl das Wasser dort rund um die Uhr verfügbar ist und eine viel bessere Qualität hat", so Wasserexperte Stefan Uhlenbrock.

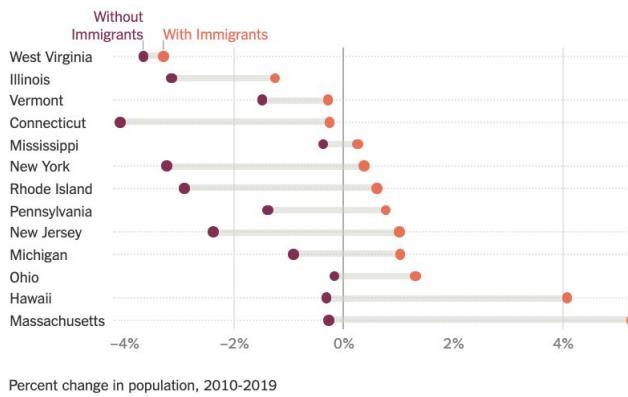

In der Zukunft wird sich das Problem der Wasserkrise voraussichtlich noch verschärfen. Dafür gibt es zwei Gründe: Einerseits gibt es schlicht mehr und mehr Menschen auf der Erde - und damit einen höheren Bedarf an Wasser. Seit den Achtzigerjahren steigt der globale Wasserverbrauch jährlich um etwa ein Prozent. Der Anstieg liegt zum Großteil am zunehmenden Wasserbedarf in Entwicklungs- und Schwellenländern, wobei deren Pro-Kopf-Verbrauch immer noch

@lisacroft

State-by-state population estimates [recently released](#) by the Census Bureau make this clear. Four states lost population in the last decade, but nine others would have also shrunk if not for the addition of foreign-born residents.

Population Change, With and Without Immigrants

Four states lost population this past decade, and nine more would have lost population without immigration.

A decade ago, the population picture was more robust. No state showed an overall population decline, and only seven states depended on immigrants for population growth.

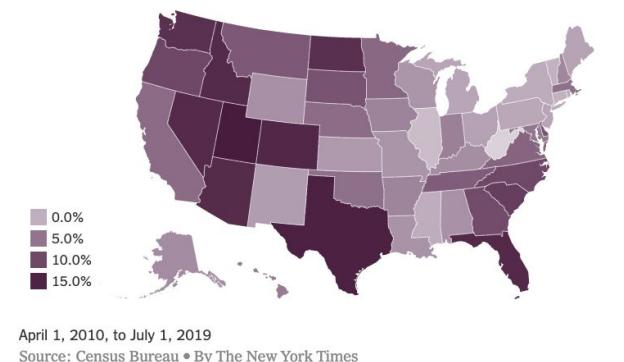

The figures, which are the last major estimates the bureau will release before the 2020 census, separate population change into three major components: natural change, as in births vs. deaths; domestic migration, the movement of Americans between states; and the arrival of immigrants.

The big picture is of a country growing more slowly than it ever has.

others, particularly states that already tend to lose population from migration to other states.

Population Growth by State in the 2010s

The fastest-growing states tended to be in the South and West.

In Michigan, for example, where 190,000 immigrants arrived, the population over all grew by 100,000, meaning the state would have shrunk without immigration. New Jersey had a net gain of 90,000 residents, bolstered by the addition of nearly 300,000 residents from overseas.

The estimates show that the United States took in more than a million immigrants in both 2015 and 2016, but that the numbers have fallen in the three years since President Trump took office, dipping below 600,000 in 2019.

The four states estimated to have lost population this past decade were West Virginia, Illinois, Connecticut and Vermont.

Population loss directly affects political representation. Seats in the House of Representatives and the Electoral College are tied to the decennial census. If the 2019 estimates are extrapolated one more

votes, who doesn't

It's the last week of the year! We from Datawrapper are looking back on a year of two new hires and one rehire (we've five people now), chart redesigns, landing pages, four new home for our blog (you're in the right now!), lots of bugfixes, and four chart types. What do you want to know what the next year will bring for us, head over to Gregor's road map!

And election year in Europe, I want to take a general look at voter turnout.

The voter turnout tells us what percentage of the eligible population showed up to vote; actually turns up to the ballot or election day. Turnout is quite stale in European countries:

To the decisions I made around this chart, we have a lot to

say on. We're comparing apples with oranges: The last European elections happened in different years. Of the highest turnout, only one country is voting in 2017.

To compare these values, I think so. But I took look firstly measures: I chose a choropleth map as my chart type. Why do I feel measure? Let me explain. Afterwards, I'm very happy to say that choropleth maps are a bit dull because they're appropriate and sufficient.

You can clearly see when chart types were introduced. We started with the basics in 2012: tables plus box, line, pie & donut charts. Maps joined in 2014. This year, we added arrow, range, area and scatter plots.

Here are some observations that surprised us:

1. Tables became big. We didn't know what it is with these tables. We offered them from the beginning, but as opposed to bar and column charts, they grew closer to our users' hearts every year. In 2017, one out of six charts was a table – mainly on the classic bar chart and column chart. Do we have an explanation? We have no clue. Do we have one? Let us know in the comments!

2. A steady stream of published Datawrapper charts are bar charts – and this never changed. Last year, we introduced new kinds of bar charts (stacked, split & bullet) and we're happy to see them replacing some of the shares of the classic bar charts. In total, 25% of all charts are still some sort of bar chart. As you can see at the bottom of the chart, the column chart had a different fate. In the beginning it was seen more frequently than the bar chart, but by now the column chart is rarer in the web than the bar chart.

3. Fewer pie charts. Our users have built fewer and fewer pie charts for three years now, even in absolute numbers (they've created more donut charts in absolute numbers).

4. Few implications as an advantage for our impulsive data. In this case, the main reason why I chose a choropleth map instead of a bubble chart is that my readers are less a generalist. Most of our surrounding countries (Switzerland) is way higher than it. I don't want them to remember like Bulgaria had a 40% turnout.

Columns about bars

Comparing usage of Datawrapper chart types

It's the last week of the year! We from Datawrapper are looking back on a year of two new hires and one rehire (we've five people now), chart redesigns, landing pages, four new home for our blog (you're in the right now!), lots of bugfixes, and four chart types. What do you want to know what the next year will bring for us, head over to Gregor's road map!

Afternoon chart types. Last week, Gregor and David used some numbers to see how often different chart types have been used since the start of Datawrapper's existence a bit over five years ago. We decided to share those numbers with you:

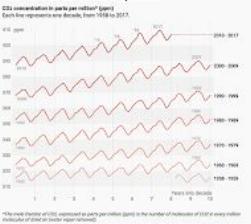

Carbon dioxide concentration over time

Fitting 6 decades of monthly data into a tiny chart

Hil Gregor here. Lisa asked me to write this Weekly Chart so she can work on some articles for our Academy (like this one).

This week we're looking into a fascinating monthly timeseries on carbon dioxide concentration in the atmosphere, published by the U.S. National Oceanic and Atmospheric Administration (NOAA).

Carbon Dioxide Concentration By Decade

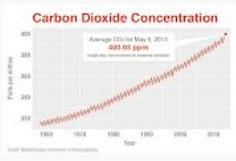

The chart shows a couple of things:

- * First, we notice that over the last six decades, carbon dioxide concentration has increased steadily, which is why the lines stack up nicely in a non-stacked chart type like this.
- * And the chart doesn't yet show that CO2 concentration is going up, it even reveals that the pace of the increase is accelerating as the vertical space between the decades lines is getting wider and wider.
- * We're also able to see the periodic pattern that follows the seasons. Carbon dioxide concentration hits a low around September, climbs up to a peak the next May, from where it then drops to the next low in September etc.
- * Finally, this form allows comparisons between the peaks and lows of different years. For instance, we can see that the "September low" of 2017 was already higher than the "May peak" of 2014.

Chart choices

So why did I decide to split the time series into separate lines per decade? To explain this let's take a look at the typical form used for this dataset, like the one below that was published on NASA's website in 2013.

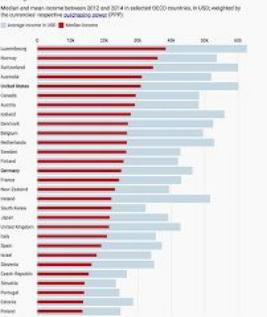

The problem with this is that it's not very effective to compress almost 60

What the difference between mean and median tells us about income inequality

The tale of the seven workers

This week we'll have a closer look at the concept of mean (= average \bar{x}) and median: It's a longer Weekly Chart than you're used to, so get ready for the ride:

Average vs median Income

Maybe you don't understand what the chart wants to tell you, I hope that will be different at the end of this article:

Median vs Mean

The mean in the chart answers the question: "If income would be equally distributed to all people, how much would everyone earn?". The median answers the question: "What does the person earn who earns exactly more than 50% of all people?"

Let's imagine a country with the beautiful name "Country A": Seven hard workers live in Country A. Person 1 to Person 7. Everyone earns exactly 2 Dollars each year (that's ok, because, um...Brazil only costs 2.00001 Dollars).

How would we calculate the average mean income from here? Most of us learned that in school: We divide the total income in this country by the number of people:

Mean

How many people exist? Seven.

How many Dollars do they all earn together? 14 Dollars.

The problem with this is that it's not very effective to compress almost 60

Marriage? Maybe later.

What's the difference between mean and median income, as of 2014?

Last week, I made a simple chart and a big explainer about the difference between mean and median income, so this week, we'll keep it short: It's our second Weekly Chart ([Part I](#)). And this is about a topic that would have been of more relevance for most of us fifty years ago: Marriage.

In 1977, half of the US population was married by the age of 25. Nowadays, it's just one out of ten.

Share of the married US population in different age groups. E.g., in 1976, 30% of the people were married by age 25, while only 12% of the people who were married between 21 and 25 and 26 to 30 were married.

Since 1977, the number of married 15-17 year olds has grown steadily. Before 2000, the rate was lower than the rate of other age groups. After 2000, the rate of growth has been much higher than the rate of other groups. The chart also shows a slight dip in the early 2000s.

We can see that each older age group, the gap grows more slowly.

People marry later, they have more children, they are more educated than marrying in general. In marriage, early in life, in the fifties and sixties, everyone got married before they were 20 years old. (Connection: "Everyone is free to fail." These days, only a third of the US population gets married before they turn 30. But a far bigger share than forty years ago gets married in their 30s and 40s. When it comes to talking voice, 30 is the new 20).

Look, it's our first arrow chart in a Weekly Chart! Why is it an arrow chart? That's why:

Chart choices

I love arrow charts because they are direct. They show you a lot of information at once: The same data in the form for different categories at two dates, and how these categories changed between these dates. Arrow charts are basically a split bar ("State at two dates") plus a bar chart with positive and negative values ("Change between two dates").

It's the beauty of charts that they aggregate numbers so much, but it's also their danger. So I wanted to see someone raise the chart, if and when people multiply depends on a lot of factors, e.g. their religion or when they finish their education. A big factor is gender. Men as well as we all will assume right and as we can see, men marry earlier than women at least in the US. But we also see that married before they were 30 years old. (Connection: "Everyone is free to fail." These days, only a third of the US population gets married before they turn 30. But a far bigger share than forty years ago gets married in their 30s and 40s. When it comes to talking voice, 30 is the new 20).

Chart choices

So why did I only show the age group as "20-24-year-olds"? Why not show many of the 40- or 50-year-olds married? That's because the share of the people who are married really goes down the older they become. People divorce or their spouses die. I counted them as "not married" in this chart.

But what will happen with these big jumps in the lines, you ask? Unfortunately, I have no idea. I assume that this is a move in the data in a flaw in the data. I like to look at data from UNstats, who collected 2010 sample percentages of census returns of the last decade for us. If you know a better source than this, please let me know!

If you liked this chart, definitely visit Nathan Yau's own personal data-experience "Ten Years of People Who Married, Given Your Age" and "Marrying Age". I saw you next week!

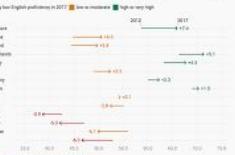

How good is your English?

There is no perfect chart. Just weighted priorities

Last week we looked at marriage, but that actually was an excuse to talk about bringing measles to a chart. This week's Weekly Chart will be about English skills as measured by ET, but that's actually an excuse to talk about priorities and compromises in chart design.

Do people speak English better or worse compared to five years ago?

ET English proficiency score in 2012 for 2011's selected countries. The scores is a mostly linear trend of ET English scores from 200 to 100+ from people who take the ET English tests online.

Look, it's our first arrow chart in a Weekly Chart! Why is it an arrow chart? That's why:

Chart choices

I love arrow charts because they are direct. They show you a lot of information at once: The same data in the form for different categories at two dates, and how these categories changed between these dates. Arrow charts are basically a split bar ("State at two dates") plus a bar chart with positive and negative values ("Change between two dates").

Our arrow chart shows exactly the same information as these two bar charts. Not just that, arrows charts connect this information. We see the relative relationship between the change for different countries and over time.

For example when we look at the selected countries in our chart, the top, we see that the countries with English skills had any more, lower or very low English skills in 2012. None of the countries with strong English speakers increased in English proficiency. That something we could not have spotted easily in a regular chart.

So arrow charts are better, right? Because they show more? Well, not necessarily. Arrow charts are hard to read. I mean it took you a lot more seconds to figure out what's going on up there.¹⁷ That makes sense. It just takes longer to read every chart with three variables compared to a classic bar chart with just one variable.

There is no perfect chart, just statements that people want to make and weight priorities – priorities for what as chart creators, e.g. grabbing the readers attention, honesty or beauty. In this case, we need to weigh up giving our readers the option to get more complex insights out of the data, and being able to understand the chart faster. The bar chart gives readers fewer insights but is faster to read. The arrow chart gives more insights but is harder to read.

Both are good charts. Which chart we choose says more about our priorities than about whether they're good at creating charts.

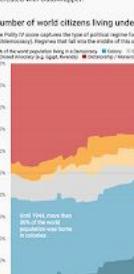

Our world in the charts

There is no perfect chart. Just weighted priorities

This week I want to turn the Weekly Chart to a more serious publication I admire massively. Our World in Data has lots of data and many of you already knew this source, but here's the team behind it: Max Roser and his team look at the big picture to fight the "ignorance about global development",

The team gathers a lot of data to show this big picture. Here's a chart showing tool for their needs. Head's off to check it out.

Number of world citizens living under poverty

I achieved these research goals, their great writing and their great visualizations. Here's a quote that makes their vision clear:

The world's people are living in extreme poverty at only 10 percent of the level in 1990. In 1990, it was 2.7 billion. In 2014, it was 1 billion. One billion people are still living in extreme poverty in 2014. This is the headline. But there is a lot more to it than that.

Our World in Data builds a correspondent to the usual news headlines. This one is the opposite of what you'd expect: Read the World's news headlines, you'll see that most stories are about poverty.

So if you don't know what's happening, just look at the news. If you don't know what's important, just look at the news. If you don't know what's interesting, just look at the news. If you don't know what's newsworthy, just look at the news. If you don't know what's important, just look at the news. If you don't know what's interesting, just look at the news.

An added bonus: Every year the tool is updated. Under Creative Commons, so I could just copy and paste the chart up there from one of their articles, so can you.

I have mentioned it before, I'm not the only one who likes Datawrapper. He's got a lot of great work and Datawrapper is an excellent platform for creating charts. I've seen some great work from others. If you're interested, go to Datawrapper's blog to see what other people are doing with Datawrapper.
